Box Patent Application  
Assistant Commissioner for Patents  
Washington, D. C. 20231

Enclosed herewith for filing is a patent application, as follows:

Inventor(s): Kossovsky, Nir ; Brandegec, Bear; Arrow, Alexander K.  
Title: Online Patent And License Exchange  
X Return Receipt Postcard  
X This Transmittal Letter (in duplicate)  
32 page(s) Declaration For Patent Application and Power of Attorney  
44 page(s) Specification (not including claims)  
14 page(s) Claims  
1 page Abstract  
28 Sheet(s) of Drawings  
1 page(s) Recordation Form Cover Sheet (in duplicate)  
2 page(s) Assignment

**CLAIMS AS FILED**

For	Number <u>Filed</u>			Number <u>Extra</u>		<u>Rate</u>		Basic Fee
Total Claims	48	-20	=	28	x	\$18.00	=	\$ 504.00
Independent Claims	12	-3	=	9	x	\$78.00	=	\$ 702.00
<input type="checkbox"/> Fee of _____ for the first filing of one or more multiple dependent claims per application								\$
<input type="checkbox"/> Fee for Request for Extension of Time								\$

Please make the following charges to Deposit Account 19-2386:

- ☒ Total fee for filing the patent application in the amount of \$ 1,896.00
- ☒ The Commissioner is hereby authorized to charge any additional fees which may be required, or credit any overpayment to Deposit Account 19-2386.

CROSS-REFERENCE TO RELATED APPLICATIONS

The present application claims priority from U.S. patent application Ser. No. 09/371,614, filed August 10, 1999, which claims priority from provisional patent application Ser. No. 60/124,847, filed on March 17, 1999.

BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates generally to electronic commerce and, more particularly, to electronic commerce of intellectual property rights.

Related Art

Effective licensing of intellectual property (IP) rights and, in particular, patent rights, presents unique challenges due to the complexity of the laws regulating the acquisition and enforcement of IP rights on the one hand and the intricacies of evaluating the potential values of the emerging technologies sought to be protected by the IP rights on the other. Patent rights, for example, require formal application and evaluation proceedings (patent prosecution) in the United States patent and Trademark Office that may last for several years. Under current laws, a patent grants its owner a limited monopoly in the patented invention starting on the date the patent is granted for a term of 20 years from the filing date of the patent application. Thus, the effective patent term may be

SUMMARY OF THE INVENTION

The method and apparatus of the present invention provide an online patent and license exchange which enables potential licensors and licensees of patents  
5 and other intellectual property rights to efficiently and reliably transact IP license or assignment agreements. Three markets are part of the exchange: a license market, an options market and a securitized asset cash flows market. The markets of the online  
10 patent and license exchange comprise three integrated components: information, transaction, and fulfillment. Information is exemplified by a comprehensive database of IP rights offered for licensing on the exchange, including a reliable market estimation of the both the  
15 value and relative financial riskiness ( $\beta$ ) of each IP asset listed on the exchange. Transaction is exemplified by a price discovery mechanism and transaction closing service; fulfillment is exemplified by a patent and royalty insurance service and an escrow  
20 service.

A method of providing a valuation of an IP asset, according to the present invention, is based on call option pricing theory and uses information about the IP asset and data from publicly traded companies in a same  
25 technology classification as the IP asset. Information about the IP asset includes estimated cost and time to commercialize a product based on the technology of the IP asset and remaining term of a central patent. The invention further includes a method of generating a  
30 suggested asking price for an IP asset using the valuation and specified licensing terms.

In another aspect, the invention includes an index of market value of intellectual property belonging to a technology classification. The index for each

classification uses enterprise values of publicly traded companies operating within the classification. The index is useful for generating a relative measure of financial risk ( $\beta$ ). Finally, a Quantitative Asset Database for storing quantitative information about attributes of technology described by an IP asset is also provided.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 21 illustrates results of a price calculation displayed by the web browser of Fig. 2A on a screen of a client computer during operation of the computer system of Fig. 1.

Fig. 22 illustrates an additional input screen for a pricing calculation displayed by the web browser of Fig. 2A on a screen of a client computer during operation of the computer system of Fig. 1.

## 20 DETAILED DESCRIPTION OF THE INVENTION

A computer system 100, according to an embodiment of the invention is shown in Fig. 1. Computer system 100 includes a server computer 110 and a plurality of clients 120n (where n = A, B, C, D, etc.) connected via global-area network (e.g., the Internet) 130.

Fig. 2A illustrates the hardware/software structure of a client computer 120n. During operation of computer system 100, a web browser program 210 is executed on top of operating system 220, which in turn controls hardware layer 230. Hardware layer 230, in turn, provides a physical connection to global-area network 130.

Fig. 2B illustrates the hardware/software structure of server computer 110. During operation of

computer system 100, server program 240 is executed on top of operating system 250, which in turn controls hardware layer 260. Hardware layer 260, in turn, provides a physical connection to global-area network 130. Server program 240 also stores and retrieves information in database 270 via operating system 250.

Users of computer system 100 access the patent and license exchange of the present invention via a client computer 120n. Web browser program 210 first establishes a connection to server program 240 over global-area network 130. Users can then access a website for the patent and license exchange via web browser program 210, server program 240 and database 270.

Server computer 110 can be any special or general purpose computer suitable for maintaining a website such as a Pentium-based computer, available from a variety of third parties, an UltraSparc workstation, available from Sun Microsystems, Inc. of Mountain View, Calif., an RS6000 workstation, available from IBM of New York, etc.

Client computers 120n can be any special or general purpose computer suitable for accessing a website over the Internet, such as any a Pentium-based computer, available from a variety of third parties, a Macintosh computer, available from Apple Computer, Inc. of Cupertino, Calif., etc.

Operating systems 220 and 250 are any suitable operating system for controlling client computers 120n and server computer 110 such as Windows98, Windows NT 4.0 or Windows2000, available from Microsoft Corp. of Redmond, Wash., MacOS 8.5, available from Apple Computer, Inc., any version of the Unix operating system, etc.

Web browser program 210 is any web browser program such as Internet Explorer 5.0, available from Microsoft Corp. or Netscape Navigator, available from Netscape Communications of Mountain View, Calif.

- 5           Fig. 3 is a flow diagram of an exchange operation 300, in accordance to an embodiment of the invention. First, in stage 310, a seller stores data describing the IP listed on the exchange in database exchange 270. A sample of the information stored by the seller in  
10   exchange database 270 is shown in Figs. 5A-5C. Figs. 5A-5C are partial views of patent information page 500 listing the information captured in exchange database 270 for a given patent listed on the exchange. The buyer can view the information shown in Figs. 5A-5C by  
15   simply scrolling the contents of patent information page 500.

- Fig. 15 is a flow diagram of stage 310A which is an alternative embodiment of stage 310, in which a seller stores data describing the IP listed on the  
20   exchange. In stage 310A, an IP asset offered for sale or license can consist of a single patent or multiple patents pertaining to the same technology. Additionally an IP asset can include pertinent trademarks or copyrights. In stage 311, the seller  
25   creates a portfolio for the first time or adds a patent, trademark, or copyright to an existing portfolio. The listing screens for entering trademark or copyright information are shown in Figs. 16A and 16B, respectively. The discussion below assumes the IP  
30   portfolio includes at least one patent, and that one patent can be considered a central patent. Those skilled in the art will readily appreciate how the exchange operation is modified for IP assets that do not include a patent.

Stage 311 is shown in detail in Fig. 17A. In stage 311A, the seller stores basic and legal information about the IP asset, as illustrated, for example, in Figs. 18A and 18B.

5 In stage 311B, the buyer enters financial information that will be used to calculate a suggested price using the TRRU valuation model, described below under Exchange Financial Operations. A sample input screen is illustrated in Fig. 18C. The TRRU valuation  
10 data includes five fields : (1) Estimated time until a product based on this technology can be launched, 1810; (2) Estimated cost remaining for product development, 1820; (3) Central patent expiration date, 1830; (4) Sector, 1840, and "pure play," 1850, category; and (5)  
15 (Optional) Approximate capital invested to date, 1860. The commercial sector and pure play category, narrowly focused market segment within the sector, are described in connection with the TRRU valuation model.

In stage 311C, the buyer enters data on licensing  
20 conditions including (1) field of use; (2) whether a license is exclusive; (3) maximum number of licenses, if any, if not exclusive; and (4) whether a license is assignable or can be sub-licensed. One example of licensing data input is illustrated in Fig. 18D.

25 In stage 311D, the seller enters a quantitative characterization of the technology which is stored in exchange database 270 in a Quantitative Asset Database. The Quantitative Asset Database provides a numerical record of the operational and competitively  
30 advantageous features of the technology. The fields of the Quantitative Asset Database are units in SI (Scientifique Internationale) units, a minimum value achieved by the technology, expressed in SI units, a maximum value achieved by the technology, expressed in

SI units, and a comment field. For example, to describe a patent for a superconductor with 0.01-0.05% current loss at -30 to -10 °C, the seller would enter "percentage" in the unit field, "0.01" in the minimum value field, "0.05" in the maximum value field, and "current loss" in the description field. A second category would describe the temperature range. Another example of the fields of the Quantitative Asset Database is illustrated in Fig. 18E. The Quantitative Asset Database provides an additional tool to buyers in searching exchange database 270, in stage 320, discussed below, beyond natural language searching. The remaining stages of stage 310A in which asset(s) are TRRU valued (stage 312) and asset(s) are priced and prices are posted (stage 313) are described below.

Returning to the flow of Fig. 3, a potential buyer can then retrieve the information stored by the seller in exchange database 270 by searching exchange database 270 in stage 320. A search menu page 600 is shown in Fig. 6, while partial views of a search page 700 are shown in Figs. 7A and 7B. The buyer is able to select among several search options on search menu page 600. The buyer can then enter search criteria on search page 700. The buyer can view the information shown in Figs. 7A and 7B by simply scrolling the contents of search page 700. The results of the search are shown in search results page 800 (Fig. 8). The buyer can view the information stored in exchange database 270 for each of the patents returned by the search by simply clicking on a corresponding link on search results page 800. This information is displayed in results information page 900 (Fig. 9).

If the buyer decides to submit a bid on one of the patents listed on the exchange, the buyer can then

submit a bid by entering the bid's terms on bid page 1000 (Fig. 10). The bid is received by computer system 100 in stage 330 and transmitted to the seller in stage 340. Fig. 11 illustrates an auction status page 1100  
5 used to notify buyers and sellers on the status of current bids. As shown in Fig. 11, each market participant can act as both a seller and a buyer. The seller can then obtain more detailed information about each bid submitted for the patent by clicking on a  
10 corresponding link on auction status page 1100, causing bid detail page 1200 (Fig. 12) to be displayed.

Once the seller has received a satisfactory bid, the seller can accept the bid by selecting a corresponding link on bid detail page 1200. The bid  
15 acceptance is received by computer system 100 in stage 350. The buyer is then notified of the acceptance of the bid and the patent is transferred to the buyer in stage 360, a contract finalization and fulfillment stage during which due diligence is conducted and  
20 insurance and escrow services are provided. Fig. 13 illustrates a message board page 1300 used to communicate the acceptance of the bid and other closing related information to sellers and buyers. Once the transfer of the IP rights listed on the exchange has  
25 been completed, operation 300 terminates.

Fig. 4 is a flow diagram illustrating an auction, also known as a price discovery operation 400, in accordance to an embodiment of the invention. Auction operation 400 is similar to exchange operation 300,  
30 except that multiple bids may be entertained by the seller in stages 410 and 420. Once computer system 100 has determined that, in accordance to (seller-controlled) predefined auction rules, the last offer has been received, the selected bid is transmitted to

the seller in stage 430. Stage 440 then determines whether the seller has accepted the selected bid, in which case the IP rights are transferred from the seller to the buyer in stage 450, a contract finalization and fulfillment stage during which due diligence is conducted and insurance and escrow services are provided. Otherwise, stages 410-440 are repeated until either the seller either accepts a bid or withdraws the lot from the auction.

- 10       The exchange website (pl-x.com) supports three separate markets: a patent asset market, an asset options market, and a securitized asset cash flows market.

The Patent Asset Market

- 15       The patent asset market is an electronically-operated forum for buying and selling IP rights. A corporation in need of new products for its product pipeline shops the market, brushing over technologies that are not of interest, while, after conducting commercially reasonable evaluation, placing bids on those that are. To facilitate this, the exchange provides a user-friendly graphic interface, a comprehensive listing of available technologies, an intuitively easy way to search the listing to find those of interest, a suggested whole asset valuation, a measure of financial risk, and a suggested selling price for each technology offered. The actual price, agreed upon or "discovered" by buyer and seller in the markets, will be independent of either the whole asset value or the suggested license price. In the interest of expediting transactions, the exchange provides a suggested price and measure of financial risk, denoted by  $\beta$ .

The Asset Options Market

Calls and puts on the exchange auction market enable buyers, sellers and long term holders to hedge their IP interests. Similar to the asset market, the options market is an electronically-operated forum for buying and selling IP rights. The specific rights are options to technology which are sold concurrently with an option exercise price that reflects the costs of converting the option into a full license or patent sale. Similar to the asset market, the exchange provides a user-friendly graphic interface, a comprehensive listing of available technology options, an intuitively easy way to search the listings to find those of interest, and a suggested selling price for each option offered. It is conceivable that a single IP asset could be offered simultaneously as a license and as an option. The exchange electronically monitors the factors affecting pricing continuously so that the recommended asset and option prices are rationally related.

20 The Securitized Asset Cash Flows Market

This market enables trading in grouped IP assets. The groupings and valuations are modeled on Real Estate Investment Trusts (REIT's).

Market Participants - Qualified Licensing Agents

25 The computer system of the present invention provides an ideal IP rights exchange for high integrity participating global buyers and sellers. These participants, known as Qualified Licensing Agents ("QLAs"), must meet certain quality standards as shown in the Table 1 below. Principal QLAs are originators or owners of IP assets or buyers and users of IP assets. Intermediary QLAs are agents acting on behalf of a principal buyer or seller. Government entities, universities and businesses not meeting the exchange's

participation criteria or not wishing to participate directly, may buy or sell IP rights through intermediary QLAs, as shown in Fig. 14.

Table 1.

QLA	TRANSACTIONAL QUALIFICATIONS	STANDING QUALIFICATIONS
Government	Applied for a minimum of ten patents per year in each of the immediately preceding three calendar years.	An affiliate of an official State, Federal, United Nations, European Union or Asian government agency.
University	Applied for a minimum of five patents per year in each of the immediately preceding three calendar years or maintains an inventory of at least ten unlicensed or otherwise available patents.	A college or university with state, national government or national educational association accreditation.
Business Entity	Applied for a minimum of five patents per year in each of the immediately preceding three calendar years or maintains an inventory of at least ten unlicensed or otherwise available patents.	An entity for which at least one class of security, of it or an affiliate lists on one of the world's top three exchanges: New York, London or Tokyo, or is a company listed on the Financial Times' World Stock Markets pages (selected on the basis of company capitalization), or is listed on a national exchange certified by the

		California Commissioner of Corporations under Section 25101 (a) of the California Corporations Code.
Law Firm (Intermediary acting on behalf of a patent buyer or seller)	The firm must, in the aggregate, close licenses and/or sales of at least ten patents per year.	Each attorney participating through the particular firm must be in good standing with at least one state bar or comparable national regulatory authority with a supervising partner who is a member in good standing of the patent bar.
Other	Capitalization requirement and bond, terms pending.	Three letters of recommendation from current exchange qualified licensing agents who are in good standing.

#### Overview of Auction Process

The auction markets offer a personalized, inviting and friendly environment. A brief description of the market process and the business experience follows.

5 Details of auction operations are provided below.

#### Exchange Auction Access

The Exchange services two types of participants - QLAs and niche participants. The QLA, whether an attorney or licensing executive, has unlimited access

10 to the site for listing, inventory searches and bidding. The niche participant has access to different elements of the site depending on the terms of the agreement with the exchange. For example, Inventors

are a niche participant. On the markets of the Exchange, Inventors have the opportunity to offer patented, copyrighted, or trademarked intellectual property for license or sale. However, unlike QLA's

5 Inventors do not have the right to purchase or license and inventors are not offered certain insurances, such as Royalty Insurance, that are available under certain conditions to QLA's.

#### Auction Flow

- 10 The exchange offers an intuitive, easy and fun IP assets search and bid experience.

Searching for patents A powerful search engine lets participants search for particular items on the site. They are able to run queries from exact matches

15 to "and/or" scenarios using a combination of natural language and logic searches. The latter searches can utilize the Quantitative Asset Database.

Navigating the Site An intuitive and elegant menu-driven Web browser makes navigating the site and

20 completing listing, search and bid forms easy. A context sensitive help facility supports all software functions.

Exploring Inventory A sophisticated bidder interface reviews online product information including

25 detailed product descriptions and images (graphs, charts, and photos), as well as real-time bid information. This interface provides optimal participation and ease of use.

#### Scheduling Special Auction Events

- 30 One of the crucial success factors for the exchange market is to bring the maximum number of buyers interested in specific IP assets to the opening of special auction events for selected IP assets in inventory. A simple means of achieving this goal is to

set up a regular auction schedule and publicize in advance so that QLAs can set aside time to participate in the auction.

#### Exchange Financial Operation

##### 5       Independent Valuation to Expedite Pricing

Every patent listed on pl-x.com will receive a valuation based on the TRRU valuation model. The actual license price, agreed upon by buyer and seller in the pl-x.com market, is independent of the pl-x.com suggested valuation and the seller's suggested price and is discovered through market mechanisms. The TRRU valuation and the suggested price are provided by the pl-x.com exchange as a service to both buyers and sellers to help expedite valuation and negotiations.

10       The seller can chose whether to use the TRRU value as their asking price, as their secret floor, or as a point of reference for their own valuation process. The TRRU value is designed to give owners a "reality check," so they don't price a patent out of the market

15       - or undervalue their intellectual property and to give buyers confidence that the asking price is reasonable. The TRRU valuation also assists pl-x.com in determining the amount of insurance coverage to be provided and the commission due.

20       

##### 25       TRRU Valuation Model

The TRRU valuation model combines real options theory with data from publicly-traded, technology-rich companies to compute reasonable market values for intellectual property that aid buyers and sellers to converge on a fair market value. The valuation model is grounded on the concept that a patent behaves financially as if it were a call option on a future technology asset. A patent, like a call option, is a

30

right to an asset that may or may not have future value.

The Black-Scholes option pricing formula for call options on stock has become widely accepted. According to the formula, the value of a stock call option C depends on the option strike or exercise price, X, the price of the underlying stock, S, the time until the option must be exercised,  $\tau$ , the variance of the stock price,  $\sigma^2$ , and the risk free rate of return r, as

$$C = SN(d_1) - Xe^{-r\tau}N(d_1 - \sigma\sqrt{\tau}) \quad (1)$$

where

$$d_1 = \left\{ \ln\left(\frac{S}{X}\right) + r\tau + \frac{\sigma^2\tau}{2} \right\} / \sigma\sqrt{\tau} \quad (2)$$

and the function N(d) is the standard normal cumulative distribution function used in statistical theory.

In the TRRU valuation model, an adaptation of the Black Scholes formula is applied to compute the value of intellectual property using measurable features of the patent or patents on offer, or of values of comparable technologies, in place of the values used for call options on stock. In place of the strike price, X, the amount of money that must be spent by the owner of a call option in order to receive the underlying stock, the TRRU valuation model uses the remaining product development cost, which is the amount of money that must be spent by the owner of a patent in order to turn the raw technology into a commercial product. The time variable,  $\tau$ , is interpreted as time until launch, that is, the time it would likely take a well-funded corporate entity to turn the patent in its present state of development into a product ready for launch. For the risk free rate of return, r, which has

the conventional meaning, the offered rate on 90-day U.S. government treasury bills is used.

The conceptual analogy to the price of the underlying stock,  $S$ , for valuing intellectual property is the value of the underlying technology if it were a finished product. In place of the stock price,  $S$ , the TRRU model uses a proxy value based on the mean enterprise value per product at launch,  $M_{CAT}$ , of small, publicly-traded companies with products in the same technology niche as the intellectual property being valued.

The exchange has defined a set of major commercial sectors which are expected to span the technologies listed on pl-x.com. A suitable list of technology sectors is provided in Table 2

Table 2. Technology Sectors

Sector No.	Sector Name
1	Advanced materials
2	Information technology
3	Automotive technology
4	Express package transport and logistics
5	Health technology
6	Aerospace and defense
7	Agri-biotech, nutraceuticals, food formulas, and food additives
8	Food processing and harvesting technology
9	Rail, water transport, and trucking technology
10	Firearms, explosives, and lasers
11	Commerce logistics, including financial instrument technology
12	Telecommunications
13	Consumer entertainment devices
14	Consumer household products
15	Basic materials and natural energy procurement
16	Storage and environmental preservation technology
17	Apparel

18	Building structure, manufacturing equipment, and civil infrastructure technology
19	Software

Each major sector, in turn, includes multiple "pure play" categories, which are narrowly focused market segments within the major sector. For example, the information technology sector includes the pure play categories of digital video processing, remote control technology, network/communication security, digital memory devices, and programmable logic devices, to name just a few. For each pure play category, a suitable number, for example, from about 3 to 30 pure play companies, whose value is entirely tied up in a single product or small number of products within the pure play category have been identified. The suitability of each pure play company is monitored regularly by the pl-x.com financial operations staff, and additions or deletions are made to each category when companies become diversified, get acquired, or cease developing a product.

The parameter  $M_{CAT}$  used in the TRRU valuation calculation is determined from the enterprise value of the pure play companies in the same pure play category as the IP asset being valued. Enterprise value, EV, is the market capitalization, defined as the number of shares outstanding times the share price, minus the book value, defined as the total assets less total debt of the company. The mean technology value per product at launch for each company,  $M_{cpny}$  is given by the enterprise value divided by the number of products, NP, and modified by the mean of the time until launch of the NP products, MTL, according to the formula

$$M_{cpny} = (EV/NP) (1 + \Delta)^{MTL} \quad (3)$$

The discount rate,  $\Delta$ , defined as

$$\Delta = 0.1 + W\sigma^2 \quad (4)$$

has a minimum of 0.1 or a 10% interest rate.  $W$  is a weighting coefficient determined by exchange financial analysts. The value of  $W$  is refined over time from comparison of actual closing prices for intellectual property deals with computed TRRU model prices. The variance,  $\sigma^2$ , is defined below. For technologies generally considered to be risky, such as biotechnology, typical discount rates are between 0.3 and 0.5.

The factor  $(1 + \Delta)^{MTL}$  increases the enterprise value to what it would be when the product(s) are introduced since the stock price takes into account the fact that the company has not yet launched its products. If the company has already launched all of its products,  $MTL=0$ , then  $M_{CPNY} = (EV/NP)$ . The mean technology value at launch for the pure play category,  $M_{CAT}$  is given as the average over the  $M_{CPNY}$  values for the 3-30 pure play companies in the category.

The last variable,  $\sigma^2$ , is taken as the average of the variances about the mean of the natural logarithm of stock price returns of the companies used to calculate  $M_{CAT}$ . The variance  $\sigma^2$  provides a measure of the variability of similar technologies. To determine the value to use for  $S$ , the underlying value of a technology that has not yet been commercialized, the mean enterprise value,  $M_{CAT}$ , which refers to a product at launch, is discounted according to the time until launch,  $\tau$ . The technology value,  $S$ , may be calculated as

$$S = M_{CAT} / (1 + \Delta)^\tau \quad (5)$$

where  $\Delta$  is the discount rate of Eq. (4).

The stock prices on which  $M_{CAT}$  and  $\sigma^2$  are based fluctuate on a minute-by-minute basis. The prices are downloaded periodically from financial market data providers to exchange database 270 in Fig. 2B and the values  $M_{CAT}$  and  $\sigma^2$  are recalculated with updated data. In one implementation, closing stock prices are downloaded at the end of each business day. Alternatively, downloading and updating of values is performed at periodic intervals throughout the business day.

Finally, the TRRU valuation model modifies the computed value of the intellectual property to take into account the remaining patent term of the central patent of the IP asset being offered. An implementation of the model uses the formula

$$TRRU = C (Y_E/17)^{WE} \quad (6)$$

where TRRU is the suggested price, C is computed from formula (1) using the definitions above,  $Y_E$  is the number of years until expiration of the patent, 17 years is assumed to be an average patent life, and WE is a weighting coefficient determined by the exchange analysts from experience.

#### Price Calculation Method

The TRRU valuation model provides a suggested value for the total intellectual property asset. The TRRU value for the total asset can be modified by the seller, as described below in the detailed process flow discussion. The asking price for a particular transaction can also be modified by considerations such as field of use, exclusive or non-exclusive license, and whether the patent is assignable. In addition, the price can be composed of different components, a fee paid by the buyer initially and future obligations.

The exchange includes a method of considering all these factors in calculating an asking price.

A suggested asking price  $T_{ASK}$  is computed from the TRRU model value, with optional seller modification, by  
5 the formula

$$T_{ASK} = (TRRU * F / NL) * ((1 + CP) / 2) * ((1 + A) / 2) \quad (7)$$

where F is a fraction of the total market to which a license will be granted. The total market can be defined, for example, in terms of field of use or of  
10 geographical regions. The asking price is reduced by the number of licenses NL to be granted. The logical variable CP=1 if there is a cap on the number of licenses and CP=0 if the number is unlimited. If an exclusive license is offered, NL=1, and CP=1 so the  
15 asking price is unmodified due to the number of licenses. The logical variable A is defined as 1 if the licensee will be allowed to sublicense (asset is assignable) and 0 if the asset is not assignable. The effect of the formula is to reduce the asking price of  
20 the asset if it is not assignable.

The suggested asking price  $T_{ASK}$  can be composed of four payment components: an upfront fee, royalty rate, guaranteed yearly minimum payments, and milestone  
25 payments. The upfront fee is the amount the licensee or buyer will pay the seller on the day the deal closes. The royalty rate is the percentage of the licensee's or buyer's sales of the product that will be paid to the seller. Guaranteed yearly minimum payments are the minimum royalty owed to the seller for each of  
30 the remaining years of the key patent of the intellectual property asset, as long as an "out clause" specifying terms on which a contract is broken, is not reached. Milestone payments are payments linked to

specific events, such as achieving a certain state of product development or revenue level.

The suggested asking price can be allocated among the four payment components in any proportion. In summing the four payment components, guaranteed minimum annual payments are discounted to the present by the factor  $(1.0/(1+D))^i$  where D is the discount rate used in the TRRU model valuation, and i is the number of years in the future. A sample of a web page used by the seller in allocating the asking price among payment components is shown in Fig. 19. In one embodiment, the exchange includes a method of enabling the seller to graphically visualize the effect on yearly cash flow over the life of the asset of different allocation schemes. For example, as shown in Fig. 20, a seller can observe a graph of payments over the asset life, 2010, change, as the growth in guaranteed minimum annual payments, 2002, and upfront fee, 2004 are adjusted.

#### 20 Intangible Asset Market Index

The exchange may also include indices of enterprise value, termed collectively Intangible Asset Market Index (IAM Index). A separate index may be constructed for each market sector defined in Table 2. The IAM Index can serve as a benchmark of raw technology value in various market sectors, allows for quantitative risk measurement, and can even act as a leading indicator for shifts in stock prices in large, technology-rich companies, due to the technology component of their total value.

The IAM Index for each sector is the average of the enterprise value, EV, for a number of small, technology-rich, non-service businesses heavily dependent on intellectual property, within that sector.

The companies have minimal revenues and/or earnings and minimal infrastructure. Therefore, the enterprise value of these companies is a relatively pure measure of the value the market is assigning to the company's technology, that is, its intellectual property. Approximately 20 to 40 companies are used for each index. The companies that make up the IAM indices are not necessarily as tightly focused in a single technology as the "pure play" companies whose enterprise value is used in the TRRU valuation model. However, some pure play companies also may be used in the IAM Index.

#### TRRU Risk Metric

One use of the IAM index is to allow buyers and sellers of intellectual property to assess the risk of the assets they are buying or licensing. In assessing conventional stocks, securities analysts frequently use a parameter termed beta, the relative fluctuation of the stock price in response to fluctuations in the overall market. In calculating beta for a stock, data for an appropriate market index, such as the S&P 500, or the Russell 2000 is used. Analogously, the TRRU valuation model includes a risk parameter,  $\beta_s$ , which is calculated using the IAM index for the sector to which the technology belongs,  $IAM_s$ . Specifically,  $\beta_s$  is given by the formula

$$\beta_s = \text{Covariance}(\text{Return on TRRU}, \text{Return on } IAM_s) / \text{Variance}(\text{Return on } IAM_s) \quad (8)$$

The risk parameter provides a measure of how changes in the computed technology value of the technology asset are correlated with fluctuations in the corresponding market sector. The TRRU model additionally includes a risk parameter  $\beta_r$ , which is defined analogously to  $\beta_s$ ,

using the average,  $IAM_I$ , of all the sector indices,  $IAM_S$ . The risk metrics may also be posted as part of the data describing an asset on the exchange.

Price and Risk Metric Calculation Process

5 Determinations of the asking price and risk metrics, using the TRRU valuation model and price calculation method, are part of the process of stage 310A, in which the seller stores data describing the IP asset in the exchange database. The process of stage  
10 310A, shown in Figs. 15 and 17A-C is now described in greater detail. Values for the TRRU parameters,  $X$ , the remaining product development cost,  $\tau$ , the time until a product is ready to be launched,  $Y_E$ , the years until expiration of the patent, and the identification of the  
15 sector and pure play category are entered in stage 311B, as shown in Fig. 18C. In stage 312A, the value for  $X$  is compared with standard values as a function of pure play category and years to launch. If the value is out of range, a message is sent to the seller and,  
20 in stage 312B, the value is adjusted or approved. Also in stage 312B, a sector and a pure play category can be assigned if none were entered in stage 311A. In stage 312C, the TRRU model total IP price is computed using Eq. (6). The TRRU value 2110 and the values of the  
25 TRRU parameters 2120 used to calculate the TRRU value are displayed to the seller as shown, for example, in the top half of Fig. 21. In stage 312D, the risk metrics  $\beta_s$  and  $\beta_r$  are computed from Eq. (8).

The price and posting process (stage 313) is shown  
30 in detail in Fig. 17C. In stage 313A, the seller reviews, and optionally adjusts, the TRRU model price calculated in stage 312C. Next, the calculation of the suggested asking price using Eq. (7) is performed in

stage 313B. An example of the screens used by the seller in the calculation of the suggested asking price, allocated among components, is displayed in Figs. 19 and 22. A sample display to the seller of the results of the asking price calculation is illustrated in Fig. 21. Finally, the suggested asking price and the risk metrics are posted on the exchange database in stage 313C.

#### Patent Risk Rating And Patent Validity Insurance

10 A patent refers to a bounded region of intellectual property. As intellectual property is to real property and as a patent is to a real property title, so is patent validity insurance to property title insurance. This mandatory insurance product helps reduce the buyer's risk, and is one of the risk transfer elements that the exchange provides to expedite patent sales and license transactions.

Just as each patent will receive a TRRU value, risk measure ( $\beta$ ) and price before it is posted on the pl-x.com patent market, each patent will receive automatic validity insurance at the close of a transaction. The insurance is for the benefit of the buyer. The availability of patent insurance creates a more risk-free marketplace by reducing the risk that buyers and sellers bear in each patent sale. pl-x.com is also working to create a complete package of patent insurances including Validity-based Seller-Royalty insurance, validity plus, infringement, and enforcement insurances to facilitate the safe and efficient commercial transfer of quality patents and licenses.

#### Patent Validity Insurance

The patent validity insurance coverage will automatically cover every patent and license

transaction closing on pl-x.com. This innovative risk transfer product will enhance pl-x.com market liquidity because each pl-x.com patent buyer or licensee will be insured for the amount of the total transaction value of each patent and license. Patent validity coverage indemnifies the buyer or licensee against the risk of financial loss that can arise when the purchased patent is declared invalid. Invalidity could be declared, for example, if the inventor or patent applicant failed to disclose information in the patent application process or because of outright fraud, such as a fictitious patent or a patent offered for sale by someone other than its owner. Coverage can be provided for the buyers' purchase price or license fees, plus tooling costs and even for investment in developing the new product from the patent rights acquired.

#### Additional Patent Insurance Products

In addition to automatic patent validity insurance, coverages will be made available to cover business transacted on pl-x.com. These include (1) Patent Validity Plus for the risk of loss due to invalidity of additional amounts to be invested in product development going forward, (2) Infringement for the risk of patent infringement liability, and (3) Enforcement for a legal expenses limit for the enforcement of patent rights against others who infringe on the rights transferred.

#### Exchange Escrow Operations

A degree of trust and security between buyers and sellers is needed for any transaction to take place. An entire industry has evolved that provides trust and security in real estate transactions - the third party escrow. An escrow officer holds transaction documents

from one party and the cash consideration from the other, deducts costs and fees, and, upon instructions from the parties, releases the documents and cash. This service provides both parties with a high degree of confidence that the transaction will close as anticipated, and each side will receive the benefit of its respective bargain. No institutional, third party escrow service currently exists for buying and selling patents.

- 10       The patent market has a present, acute need for a neutral escrow service. For example, in order for a business development executive at an orthopedic implant company in Tennessee to acquire a license for a bone growth protein from a bioengineering company in
- 15       Finland, the Tennessee buyer must feel secure and confident that the cash wired to a Finnish bank or other financial intermediary will be appropriately handled and will result in the delivery of the bone protein patent. Currently, the participants in
- 20       international patent exchanges take the risk that local law and custom will protect their respective interests. However, neither the American nor the Finnish party will be willing to learn the details of international contract law nor will they take the chances on the
- 25       other party following through without some kind of third-party assurance. Furthermore, the concept of hiring local legal representation is both expensive and potentially unreliable.

- 30       The patent escrow service is a third party intermediary which holds the consideration from Tennessee and the patent title from Finland, and disburses neither item to the opposite party until both have been received and verified. Furthermore, the patent escrow, in being impartial, is responsible for

- complying with the requirements of local law for such transfers and for the collection and payment of fees, costs and commissions. The patent escrow agent will operate under contract from the exchange, and will
- 5 receive compensation for this service according to a fee schedule.

- In addition to escrow, pl-x.com will provide on-line document management tools to help both parties manage the paperwork involved in each deal closing.
- 10 The tools enable both parties in the deal to talk in a secure on-line space, to edit and review password-protected documents, and to track the progress of deal documentation all in a paperless environment. pl-x.com management believes that this service, originally
- 15 designed for the financial community, will further reduce the time it takes to close technology transfer deals and will offer both parties increased control over the documents involved.

20 Licensing Administration Operations

- The exchange fills an unmet need for cost-effective after-market licensing administration. Many companies do not have a dedicated licensing department, adequate administrative budgets, or license and royalty
- 25 compliance monitoring. Potential revenue is lost.

- The exchange licensing administration service uses a powerful information technology network for processing, tracking, and reporting royalties. This service is executed in cooperation with the exchange
- 30 escrow service. A patent buyer will respond to a royalty questionnaire which will be based on the transaction terms agreed to at closing and that were filed with the exchange escrow service. The questionnaire will be processed electronically,

reviewed by the exchange staff for inconsistencies, and then forwarded to the seller for acceptance. After the report has been accepted by the seller, the buyer will immediately receive wire instructions to deposit the

5 appropriate royalty into a special bank account maintained for the benefit of the exchange escrow service. Simultaneously, the escrow service is notified to expect the wire. The escrow service, in turn, immediately confirms receipt of the funds and is

10 responsible for wiring the funds to the seller.

#### Financial Operations for The Options Market

The options market, the second of the three the exchange patent markets, allows for trading in both call and put options, so long as market participants

15 (companies or third-party hedgers) are willing to offer them. Different motivations for trading are expected to arise depending on who is buying and selling each type of option.

#### Options Traded Between Other Sellers and Buyers

##### 20 Call Options

A patent call option is the contractual right to purchase a technology from its owner at a predetermined price before a set expiration date. Buying the technology for the predetermined price is referred to

25 as "exercising" the option, and the "exercise price" tends to be similar to the price that would be charged for exclusively licensing the technology outright from the beginning. Owning a patent call option gives the assurance that no competitor will be able to buy or

30 license the technology until the option either expires or is exercised.

A risk-averse corporate entity, with an interest in a particular patent listing, may want to purchase a call option before beginning experiments or clinical

5 trials to see if the technology works. If the technology development is successful, the entity exercises its option and owns the patent license. If it fails to meet the entity's requirements, or if the entity's business changes during the development, the option is allowed to expire, having spent much less money than it would have had it bought or licensed the patent outright from the beginning.

10 The patent owner who issues, that is "writes", the option also benefits: If the option buyer decides it likes the technology and exercises its option, the option writer receives the exercise price (normally equal to a comparable license fee if the technology were licensed outright from the beginning) plus the  
15 option price it collected when the option was written. If the buyer decides not to exercise the option, the writer keeps the option price it collected and it keeps 100% ownership of the patent, on which it can go on to offer another option to another market participant.  
20 Thus, there is a clear motivation for both call option buyers (corporate developers), and call option writer (university with patents lying fallow), to trade in this way.

#### Put Options

25 There is little motivation for a corporate developer to buy a put option (the right to sell a patent listing back to the original owner for a predetermined price) if call options are offered, since buying the technology plus a put is equivalent to  
30 buying a call and loaning the patent research institution cash. The put writer's motivation is to convince a buyer to buy the patent, and to get a cash "loan."

The price of the put option is normally proportional to risk of failure of the technology. When the risk is very high, the put option price will approach the present value of the exercise price, (exercise price)/(1 + risk free rate)<sup>n</sup>. Similarly, the exercise price would be a function of the purchase price of the patent, and when the risk is very high would approach the future value of the purchase price, (purchase price)(1 + risk free rate)<sup>n</sup>. In the hypothetical extreme case, where both parties know there is no chance of the technology working, the put price become equal to the purchase price and the strike price becomes the future value of this figure at the risk-free interest rate - buying a put option would be like buying a government bond.

#### Options Traded Between Other Parties

##### Call Options

A fraction of a call option can be bought by a second corporate developer if the first developer is cash-limited and is willing to split the eventual ownership of the product by a predetermined percentage. The second corporate developer may have heard about the technology late and want to get at least part of it. The first developer could list this "fractional call option" back on the same exchange where it found it.

Alternatively, a developer in need of cash who is working on a high-profile technology could offer minute fractions of a call option to the public. This can be done, whether the developer bought the call option from a patent option writer, or is creating the option from its own endogenous technology. This kind of "patent option offering" is analogous to a public equity offering, only the company offering the patent equity is doing so with the understanding that it may decide

to "go private" at some predetermined date several years in the future - buying back all the pieces of the call, at a premium, if the technology works out. It is feasible that the company could afford such a cash outlay, which could be much larger than the cash it received when it sold the patent calls to the public in the first place, because it will be better able to raise cash through other means once it has a workable product. This is a high-risk form of investment, since the public has no assurance that the developer will do its best to develop the patent, and the eventual value of the patent call option is related to the patent's development.

#### Put Options

A third-party nay-sayer may have reason to buy a put option from a corporate developer who bought it from the original owner. Although the put option cannot be exercised without the patent, the third party nay-sayer may feel confident that the developer will fail at developing the technology, and therefore need to get the put option back in order to "put" the patent back to the original owner. In this case, the developer would be forced to buy the put option back from the third-party nay-sayer, at a free-floating price that would obviously be higher than the price the nay-sayer paid for it (but always lower than the exercise price). The nay-sayer would therefore have won his "bet" and profited. The nay-sayer buyer would want to know the exercise price of the option from the very beginning even though he can never exercise it, because this is the upper limit of his pay-back.

#### Valuation in the Options Market

Relevant factor for pricing options on intellectual property are all included in the five

inputs to the Black-Scholes model. The "S" input into the conventional Black Scholes option pricing model, Eqs. (1) and (2), is, conveniently, also equal to the exchange's TRRU value and, where appropriate, the  
5 adjusted price for purchasing the technology outright.

Suggested values are posted next to each option listed on the options market, similar to the procedure in the license market. Valuation of technology that underlies each option is the first step, and is  
10 performed in exactly the same way as in the license market.

Financial Operations for The Securitized Asset Cash  
Flows Market

The most complex of the three exchange markets,  
15 the Securitized Asset cash flows markets allows for the buying and selling of small pieces of groups of technologies bundled together. Securitized Asset cash flows unit trading is the only example of the exchange transactions that are only occurring between buyers and  
20 sellers in off-exchange private negotiated deals. The most famous of these recently is the securitization of the cash flows of David Bowie records - known within the industry as Bowie Bonds. IP holders may bundle a group of technologies, "securitize" them into units,  
25 and lists these units, or options to own the units, on the Securitized Asset cash flows exchange.

Large research institutions may be the most likely candidates to offer Securitized Asset cash flows, as they have large quantities of related patents that  
30 would lend well to a Securitized Asset cash flows format.

Valuations in the Securitized Asset cash flows Market

The suggested value for each listed Securitized Asset cash flows unit is analogous to the book value

typically listed for each REIT (Real Estate Investment Trust) unit in today's REIT market. Each patent property bundled together in a particular Securitized Asset cash flows is evaluated according to the

5 methodology described above. The sum of these values is then divided by the number of shares outstanding in the Securitized Asset. This technology "book value" is then listed on the Securitized Asset cash flows

10 exchange next to each Securitized Asset. The actual bid and ask price for each Securitized Asset is determined by supply and demand in typical market-price discovery fashion, just as the case with REITs, or for that matter, assets on the other markets of the

15 Exchange. And, as with REITs, market price and book value are often disparate. The posted book value of Securitized Asset cash flows, however, changes more frequently than the posted book value of REITs, since the exchange Financial Operations TRRU Metrics

20 algorithms constantly update the suggested price of all units of patent pertinent to each Securitized Asset.

Data Sources

For purposes of re-calibrating the exchange valuation coefficients, "data" consists of examples of real-world intellectual property transactions in which

25 both the nature of the technology and the purchase price are disclosed. Such data is critical for continually refining our valuation model, as described above. Data for this purpose is continually generated by buyers and sellers and fed back into the exchange

30 model. Prior to trading on the exchanges, however, data is to be tabulated from press releases, from trade publications that feature technology transfer deals, and from companies and research institutions themselves.

### Auction Function

The exchange auction web site supports the following functions.

- 5     Initial buyer/seller registration. This step deals with issues relating to authentication of trading parties, exchange of cryptography keys, and the creation of a profile for each trader that reflects his/her interest in specific patent.

- 10    Setting up a particular auction event. This second step includes describing the item being sold or acquired and setting up the rules of the auction. The auction rules explain the type of auction being conducted (open cry, sealed bid, Dutch), parameters negotiated (price, delivery dates, terms of payment, etc.), starting date and time of the auction, auction closing rules, etc.

- 20    Bidding. The bidding step implements the bid control rules of the auction (minimum bid, bid increment, deposits required with bids) and for open cry auctions, notifies the participants when new high bids are submitted.

Evaluation of bids and closing the auction. This step implements the auction closing rules and notifies the winners and losers of the auction.

- 25    Trade settlement. This final step covers communicating the terms of the transfer and the next steps required for clearing the sale and securing transfer of patent rights for terms of sale.

### Auction Formats

- 30    Open Cry

Open cry auctions take the public meeting approach. In this approach the response to each bid, for example, a higher counter-bid by another party, or the decision to close the auction, happens in a short

time, sometimes in a few seconds. These auctions allow prospective buyers to: participate in the auction at the same time; and feel comfortable making counter bids in a few seconds. Traditionally such auctions are  
5 conducted with all participants present at the same location such as meeting/auction room where inter-party communication is instantaneous. Remote participation by phone and through proxy (order bid) is limited.

Sealed Bid

10 Sealed bid auctions are practiced when it is impractical for the bidders to prepare counter bids instantaneously. This could be because it takes time to prepare a counter bid, the prior bid information needed to prepare the counter bid, such as the prior  
15 bid, can not be disseminated to the other bidders instantaneously, or because the bidders are not available to participate in the auction at the same time. In single round sealed bid auction, all bidders submit their bids by a deadline, and the bids are  
20 evaluated at this deadline. In multi round sealed bid auctions, there is a deadline for each round of bids, and at that deadline either the auction is closed or a fresh round of bids is solicited by some new deadline.

Single and Multiple Round Sealed Bid

25 Single round sealed bid auctions lack the competitive atmosphere (bidding frenzy) in open cry auctions which encourages the bidders to outbid their rivals. Multiple round sealed bid auctions recreate some of the intensity and interest of the open cry  
30 format, however, this auction can be held over an unlimited time period until the ask price is met.

Bulletin Board Bid

Another bidding alternative, and one that is ideally suited to IP with only limited appeal, is to

use an electronic bulletin board approach. Information about the prior bids is published on the bulletin board - in this case, the Exchange's database - but new bids are not required in seconds. The bidders can monitor  
5 the bulletin board a few times a day for a few days, and they have a chance to offer counter-bids to the existing highest bid. This approach alleviates the communication latency and simultaneous participation requirement of the open cry auction, but retains its  
10 competitive nature.

#### Control of Bids/Offers

In an auction, the initiator of the auction or the exchange can either require the participants to submit bids or announce its own bids to see if there are  
15 participants willing to conduct trade at his bid price. When the participants provide the bids in open cry or bulletin board auction, each successive bid is higher than the previous one.

When the exchange auction master puts up the bids,  
20 he can either start with a high bid, perhaps at which no bidder is willing to trade, and lower the bid gradually until he has sufficient bidders to clear his inventory. This is the Dutch auction in real time. Alternatively he can start at a low bid, low enough at  
25 which there are more buyers than his inventory, and increase his bid until the number of buyers willing to buy his merchandise matches his inventory. Last, with IP, the preferred method of operation is to allow the Seller to control the auction or price discovery  
30 process.

#### Setting The Trading Price

Once the bidding phase is over, the bidders with the highest bids get the patent being auctioned. But the price they pay could be the same as what they bid

or lower. In Discriminative Auction, also known as Yankee Auction, the bidders pay their actual bid amounts. When the bidders are repeat customers of the seller, dissatisfaction among the bidders who have to  
5 pay a higher price compared to other bidders is sometimes of concern. This is addressed by allowing the bidders with winning bids to pay the price paid by the winning bidder with the lowest bid.

This latter policy is widely known in literature  
10 as Dutch Auction, but we will refer to it as a Non discriminative Auction, because the term Dutch Auction is also widely used to describe auctions where the exchange starts with a high price and bids the price lower while buyers have the option of buying the items  
15 at any time at the current bid price. Non-discriminative auctioning is widely used by corporations to repurchase their shares (though it is referred to as Dutch auction in this context).

A variation of the Non discriminative auction  
20 called Vickrey Auction was proposed by 1996 Economics Nobel laureate, William Vickrey. Here the winning bidder pays the price bid by the highest non winning bidder. This policy is stated to create a disincentive for speculative bidding and encourage the bidders to  
25 submit bids reflecting their true value for the item being auctioned.

#### Additional Auction Policy Variations

Each of the following policy choices is applicable to several, if not all, auction methods described  
30 above.

#### Anonymity

Many factors go into deciding what information about bids should be made available to bidders before and after the closing of the auctions. In an open cry

5 auction, one could conceal the identity of the bidders,  
or conceal the association between the bidders and the  
bids. In sealed bid auctions, the identity of the  
bidders and/or their bids could be revealed to other  
bidders after the close of auction. Alternatively,  
only the winning bids and/or bidder's identity could be  
revealed. Given the deep pockets of potential bidders,  
it may be prudent to protect the identity of all  
bidders to prevent a lack of bidding from smaller, less  
10 well funded bidders.

#### Restrictions On Bid Amount

In all auctions the seller can specify the minimum  
starting bid. When auctions of the same kind of item  
happen regularly, the minimum bid is usually some  
15 fraction (70%) of the lowest winning bids averaged over  
a specified number of preceding auctions. To speed up  
the bidding process, minimum bid increments are often  
enforced. The bid increment is roughly proportional to  
the current bid, i.e., they are smaller for lower bids  
20 and larger at higher bids.

#### Rules For Closing The Auction

Open cry auctions can finish by a posted closing  
time. Alternatively, the auctions can be kept open  
until new bids continue to arrive within some time  
25 interval of the preceding bid. One could also choose to  
close the auction if either of the above two conditions  
is met or only when both conditions are met. Dutch  
auctions could close at a pre specified time, when all  
the inventory has been sold, when the price has fallen  
30 to a pre specified level, or at some combination of  
these three conditions. This format is likely to be  
the winning formula for the exchange and its patent  
exchange.

### Evaluation Rules And Breaking Tied Bids

All auctions will have some rule for evaluating bids. When an item is being sold in an auction, generally a higher bid would be better than a lower bid. But other factors such as terms of payment can factor in a comparison of two bids. For example, a bid requiring delivery of goods on a schedule convenient to the seller may be preferred over another bid that matches the first one in all respects but has a delivery schedule inconvenient to the seller. Advance payment or payment on delivery may call for a higher valuation of the bid compared to a bid where payment is due within 90 days of delivery.

If multiple bids tie at the same value and the available inventory can satisfy some but not all of the bids, tie breaking rules are required. Preference may be given to bids that are for larger quantity, and in case of two bids specifying the same quantity preference could be given to the bid that arrived earlier. If the seller maintains a history of its auctions, it can give preference to the bidder with whom he had better business dealings in the past.

### Services Provided To Sellers And Bidders

Reserve prices (hidden lower limit on price acceptable to seller) is one service that the exchange can provide to the seller. Other high-value services will include a credit check and certification of all bidders, patent insurance to prevent against patent default, escrow and clearing services. Order bid (bidding through the exchange provided proxy to a qualified Licensing Agent) is an important service that the exchange can provide to the bidders. Alerting registered bidders to upcoming auction events and

hosting special auction events are other marketing services that help create an efficient marketplace.

#### Security Considerations

- Security mechanisms are needed to ensure that the
- 5 site announcing the auction and its rules is not sabotaged by an outsider. This includes preventing unauthorized postings and alterations as well as preventing denial of service attacks. Cryptographic tools that prove that a particular auction notice was
- 10 posted and accessible during a certain time period will be very useful.

- During the bidding phase cryptographic tools will ensure that a bid submitted is not tampered with and that it is not disclosed to other bidders in violation
- 15 of the auction rules. In open cry auctions, a verifiable connection from every bid to a known bidder will demonstrate chain of bid for verification.

#### Terms and Conditions

- The exchange bidding process allows the buyers to
- 20 request specific payment or shipping terms, these terms and conditions will be treated as part of the bid. The auction chart will display the offered terms and conditions along side the bids shown. Further, when creating the product description, the seller will
- 25 specify the range of terms and conditions acceptable to him and indicate how they are factored in bid evaluation.

#### Retraction of Auction and Bids

- During the bidding phase, under certain conditions
- 30 the seller may be allowed to stop or withdraw the auction or modify the rules. Similarly, under certain conditions the bidders will be allowed to withdraw or modify their bids.

### Closing The Auction

The auction close according to the closing rules specified. At this time, the winning bids can be treated as, and if needed translated to, traditional  
5 purchase orders. At the closing of the auction, the following additional activities need to take place.

### Notification

The exchange must communicate the results of the auction to the bidders. Depending on the auction  
10 policy, some information will be made available publicly, some common information will be made available to all bidders, and some will be communicated only to bidders to whom it is relevant. Once again security and privacy tools are needed.

### Record Retention

To prove to the bidders and the seller that the auction was conducted fairly, the auction record is digitally signed by the exchange.

Embodiments described above illustrate but do not  
20 limit the invention. In particular, the invention is not limited to any particular hardware/software used to implement the computer system of the present invention.

In the preferred embodiment, the seller maintains a high degree of control in closing the auction for the  
25 seller's intellectual property. At the time of inventory posting, the seller designates the rules for selecting the auction winner. Such rules may include highest cash price, highest royalty rate, highest bid within a specified time period, or some other parameter  
30 or combination of parameters determined exclusively by the seller.

CLAIMS

We claim:

1. A computer system for providing a valuation of an intellectual property asset, the computer system comprising:
  - at least one server computer connected to one or more client computers via a global-area network; and
  - a computer program executed by the server computer;
- 10 wherein the computer program further comprises computer instructions for:
  - storing information about the intellectual property asset in a database, the information comprising a technology classification;
  - 15 storing information about publicly traded securities according to the technology classification in the database; and
  - generating a valuation based on call option pricing theory, using the information about the
  - 20 intellectual property asset and the information about the publicly traded securities stored in the database.
2. The computer system of claim 1, wherein the
- 25 information about the intellectual property asset comprises information from legal instruments conveying rights to the intellectual property asset.
3. The computer system of claim 2, wherein the
- 30 information about the intellectual property asset further comprises estimated time and cost to commercialize a product based on the intellectual property asset.

4. The computer system of claim 1, wherein the information about publicly traded securities comprises enterprise value of companies in a same technology classification as the intellectual property asset.

5

5. The computer system of claim 4, wherein the enterprise values are updated periodically based on stock prices, shares outstanding, and book value of the companies, wherein the stock prices are transferred to the database from an external source.

10

6. The computer system of claim 1, wherein computing a valuation based on call option pricing theory further comprises using information about completed intellectual property asset transfer transactions.

15

7. The computer system of claim 1, wherein the call option pricing theory is the Black-Scholes theory.

20

8. The computer system of claim 1, wherein the computer program further comprises instructions for evaluating risk of the intellectual property asset based on a change of the valuation relative to a change in an average of enterprise values of publicly traded companies in a same technology classification as the intellectual property asset.

25

9. A computer system for determining a suggested price for transfer of intellectual property rights between buyers and sellers of intellectual property assets, wherein the rights comprise licenses and assignments of the intellectual property assets, the computer system comprising:

30

at least one server computer connected to one or more client computers via a global-area network; and a computer program executed by the server computer;

- 5 wherein the computer program further comprises computer instructions for:

storing information about a term of an intellectual property asset and about licensing conditions offered by the seller in a database;

- 10 and

generating a suggested asking price wherein a value of the intellectual property rights is modified according to the licensing conditions.

- 15 10. The computer system of claim 9, wherein the computer program further comprises computer instructions for graphically displaying on a client computer projected yearly income to the seller over the term of the intellectual property asset, based on the  
20 suggested selling price, and a balance between immediate and future payments.

11. The computer system of claim 9, wherein the computer program further comprises computer  
25 instructions for computing the balance between immediate and future payments such that the sum of the immediate payment and the future payments is equal to the suggested selling price, wherein the future payments are modified by a discount rate which depends  
30 on a risk valuation of the intellectual property asset.

12. A computer system for providing an index for market value of intellectual property assets belonging

to a technology classification, the computer system comprising:

- at least one server computer connected to one or more client computers via a global-area network; and
- 5 a computer program executed by the server computer;

wherein the computer program further comprises computer instructions for:

- 10 storing information about companies having publicly traded securities in a database, wherein the companies operate predominantly within the technology classification; and
- computing an average of the enterprise value of the companies using the information about the
- 15 companies stored in the database.

13. The computer system of claim 12 wherein the information about companies having publicly traded securities comprises a stock price, number of
- 20 outstanding shares, assets, and debts of the companies and wherein the enterprise value of each company is calculated based on the product of the stock price and the number of outstanding shares less the difference between the assets and debts of each company.

25

14. The computer system of claim 13 wherein information about the stock prices of the companies is transferred periodically to the database via the global-area network and the computer program further
- 30 comprises instructions for recalculating the average of enterprise values periodically based on updated stock prices.

15. A computer system for storing information about intellectual property assets, the computer system comprising:

at least one server computer connected to one or  
5 more client computers via a global-area network; and  
a computer program executed by the server  
computer;

wherein the computer program further comprises  
computer instructions for:

10 storing quantitative information about  
attributes of a technology described by the  
intellectual property assets.

16. The computer system of claim 15 wherein the  
15 quantitative information for each attribute comprises a  
standard scientific unit, a description of the  
attribute, a minimum value of the attribute achieved by  
the technology, expressed in the unit, and a maximum  
value of the attribute achieved by the technology,  
20 expressed in the unit.

17. A method for providing a valuation of an  
intellectual property asset using a computer system  
comprising at least one server computer and one or more  
25 client computers connected to the server computer via a  
global-area network, the method comprising:

storing information about the intellectual  
property asset in a database, the information  
comprising a technology classification;

30 storing information about publicly traded  
securities according to the technology  
classification in the database; and

generating a valuation based on call option  
pricing theory, using the information about the

intellectual property asset and the information about the publicly traded securities stored in the database.

5           18. The method of claim 17, wherein the information about the intellectual property asset comprises information from legal instruments conveying rights to the intellectual property asset.

10           19. The method of claim 18, wherein the information about the intellectual property asset further comprises estimated time and cost to commercialize a product based on the intellectual property asset.

15           20. The method of claim 17, wherein the information about publicly traded securities comprises enterprise value of companies in a same technology classification as the intellectual property asset.

20           21. The method of claim 20, wherein the enterprise values are updated periodically based on stock prices, shares outstanding, and book value of the companies, wherein the stock prices are transferred to  
25 the database from an external source.

            22. The method of claim 17, wherein computing a valuation based on call option pricing theory further comprises using information about completed  
30 intellectual property asset transfer transactions.

            23. The method of claim 17, wherein the call option pricing theory is the Black-Scholes theory.

24. The method of claim 17, wherein the computer program further comprises instructions for evaluating risk of the intellectual property asset based on a change of the valuation relative to a change in an average of enterprise values of publicly traded companies in a same technology classification as the intellectual property asset.

25. A method for determining a suggested price for transfer of intellectual property rights between buyers and sellers of intellectual property assets, wherein the rights comprise licenses and assignments of the intellectual property assets, the method using a computer system comprising at least one server computer and one or more client computers connected to the server computer via a global-area network, and the method comprising:

storing information about a term of an intellectual property asset and about licensing conditions offered by the seller in a database; and  
generating a suggested asking price wherein a value of the intellectual property rights is modified according to the licensing conditions.

25

26. The method of claim 25, wherein the computer program further comprises computer instructions for graphically displaying on a client computer projected yearly income to the seller over the term of the intellectual property asset, based on the suggested selling price, and a balance between immediate and future payments.

27. The method of claim 25, wherein the computer program further comprises computer instructions for computing the balance between immediate and future payments such that the sum of the immediate payment and  
5 the future payments is equal to the suggested selling price, wherein the future payments are modified by a discount rate which depends on a risk valuation of the intellectual property asset.

10 28. A method for providing an index for market value of intellectual property assets belonging to a technology classification using a computer system comprising at least one server computer and one or more client computers connected to the server computer via a  
15 global-area network, the method comprising:

storing information about companies having publicly traded securities in a database, wherein the companies operate predominantly within the technology classification; and

20 computing an average of the enterprise value of the companies using the information about the companies stored in the database.

29. The method of claim 28 wherein the  
25 information about companies having publicly traded securities comprises a stock price, number of outstanding shares, assets, and debts of the companies and wherein the enterprise value of each company is calculated based on the product of the stock price and  
30 the number of outstanding shares less the difference between the assets and debts of each company.

30. The method of claim 29 wherein information about the stock prices of the companies is transferred

periodically to the database via the global-area network and the computer program further comprises instructions for recalculating the average of enterprise values periodically based on updated stock prices.

31. A method for storing information about intellectual property assets using a computer system comprising at least one server computer and one or more client computers connected to the server computer via a global-area network, the method comprising:

storing quantitative information about attributes of a technology described by the intellectual property assets.

15

32. The method of claim 31 wherein the quantitative information for each attribute comprises a standard scientific unit, a description of the attribute, a minimum value of the attribute achieved by the technology, expressed in the unit, and a maximum value of the attribute achieved by the technology, expressed in the unit.

33. A computer-readable storage medium operatively coupled to a computer system for providing a valuation of an intellectual property asset, wherein the computer system comprises at least one server computer connected to one or more client computers via a global-area network, the computer-readable storage medium comprising computer instructions for:

storing information about the intellectual property asset in a database, the information comprising a technology classification;

storing information about publicly traded securities according to the technology classification in the database; and

5 generating a valuation based on call option pricing theory, using the information about the intellectual property asset and the information about the publicly traded securities stored in the database.

10 34. The storage medium of claim 33, wherein the information about the intellectual property asset comprises information from legal instruments conveying rights to the intellectual property asset.

15 35. The storage medium of claim 34, wherein the information about the intellectual property asset further comprises estimated time and cost to commercialize a product based on the intellectual property asset.

20 36. The storage medium of claim 33, wherein the information about publicly traded securities comprises enterprise value of companies in a same technology classification as the intellectual property asset.

25 37. The storage medium of claim 36, wherein the enterprise values are updated periodically based on stock prices, shares outstanding, and book value of the companies, wherein the stock prices are transferred to  
30 the database from an external source.

38. The storage medium of claim 33, wherein computing a valuation based on call option pricing theory further comprises using information about

completed intellectual property asset transfer transactions.

39. The storage medium of claim 33, wherein the  
5 call option pricing theory is the Black-Scholes theory.

40. The storage medium of claim 33, wherein the  
computer program further comprises instructions for  
evaluating risk of the intellectual property asset  
10 based on a change of the valuation relative to a change  
in an average of enterprise values of publicly traded  
companies in a same technology classification as the  
intellectual property asset.

41. A computer-readable storage medium  
operatively coupled to a computer system for  
determining a suggested price for transfer of  
intellectual property rights between buyers and sellers  
of intellectual property assets, wherein the rights  
20 comprise licenses and assignments of the intellectual  
property assets, and wherein the computer system  
comprises at least one server computer connected to one  
or more client computers via a global-area network, the  
computer-readable storage medium comprising computer  
25 instructions for:

storing information about a term of an  
intellectual property asset and about licensing  
conditions offered by the seller in a database;  
and

30 generating a suggested asking price wherein a  
value of the intellectual property rights is  
modified according to the licensing conditions.

42. The storage medium of claim 41, wherein the computer program further comprises computer instructions for graphically displaying on a client computer projected yearly income to the seller over the  
5 term of the intellectual property asset, based on the suggested selling price, and a balance between immediate and future payments.

43. The storage medium of claim 41, wherein the  
10 computer program further comprises computer instructions for computing the balance between immediate and future payments such that the sum of the immediate payment and the future payments is equal to the suggested selling price, wherein the future  
15 payments are modified by a discount rate which depends on a risk valuation of the intellectual property asset.

44. A computer-readable storage medium  
operatively coupled to a computer system for providing  
20 an index for market value of intellectual property assets belonging to a technology, wherein the computer system comprises at least one server computer connected to one or more client computers via a global-area network, the computer-readable storage medium  
25 comprising computer instructions for:

storing information about companies having publicly traded securities in a database, wherein the companies operate predominantly within the technology classification; and  
30 computing an average of the enterprise value of the companies using the information about the companies stored in the database.

45. The storage medium of claim 44 wherein the information about companies having publicly traded securities comprises a stock price, number of outstanding shares, assets, and debts of the companies and wherein the enterprise value of each company is calculated based on the product of the stock price and the number of outstanding shares less the difference between the assets and debts of each company.

10 46. The storage medium of claim 45 wherein information about the stock prices of the companies is transferred periodically to the database via the global-area network and the computer program further comprises instructions for recalculating the average of  
15 enterprise values periodically based on updated stock prices.

47. A computer-readable storage medium operatively coupled to a computer system for storing  
20 information about intellectual property assets, wherein the computer system comprises at least one server computer connected to one or more client computers via a global-area network, the computer-readable storage medium comprising computer instructions for:  
25 storing quantitative information about attributes of a technology described by the intellectual property assets.

48. The storage medium of claim 47 wherein the  
30 quantitative information for each attribute comprises a standard scientific unit, a description of the attribute, a minimum value of the attribute achieved by the technology, expressed in the unit, and a maximum

ONLINE PATENT AND LICENSE EXCHANGE

Nir Kossovsky

Bear Brandegge

Alexander K. Arrow

5

ABSTRACT OF THE INVENTION

An online patent and license exchange is provided which enables potential licensors and licensees of  
10 patents and other intellectual property rights to efficiently and reliably transact IP license or assignment agreements. Three markets are part of the exchange: a license market, an option market and a securitized asset Securitized Asset cash flows market.  
15 The online patent and license exchange includes a method of providing a valuation of an IP asset using data from companies in a similar technology classification as the IP asset, a method of generating a suggested IP asset asking price, an index of IP  
20 market value according to technology classification, a method for quantifying the financial risk of an asset ( $\beta$ ), and a quantitative database of technology attributes of IP assets.

Save as Draft | Save | Cancel | Help

This is the simple 5-step process of adding an asset on (pl-x.com).

The steps are:

- ➔ Basic Info
- ➔ Legal
- ➔ Conditions
- ➔ Financial
- ➔ Attributes

Feel free to click around to examine your choices, none of this information will be saved.

When you are finished, just click the close button to return to the demo menu.

Basic Info	Legal	Conditions	Financial	Attributes
Add to Portfolio:	Portfolio #1			
Patent Name:				
Patent Number:				
Country Issued:	Japan			
If application is pending, what is the status?	Pre-filing			
Has it been published?	Yes No			
Published Description:				
Short Descriptive Title:				
Internal Reference Number:				
Platform Sector:	Agri-biotech, nutraceuticals, food formulas and food additives			
pl-x.com Pure Play Category:	Herbal/botanical extract technology			
Razor/Razor Blade:	Yes No			
Primary Application:				
Other Applications:				
Competitive Advantage:

## Driven by:

US\$3.0 million estimated cost to bring to market

24 months estimated time to bring to market

11/04/2029 expiration date of key patent

.3 variance of the mean enterprise value per product of "Advanced Materials"

6% risk-free rate

2.0999 Black-Scholes "stock" variable\*

[Click here for details of TRRU valuation.](#)

\*calculated from US\$8.7 million mean enterprise value per product at launch of Advanced Materials products, 24 months before they launch.

**pl@**

TRRU Whole Asset Value:  
US\$ 18.0 million

2110

## Asset's Present Value Asking Price:

Asking upfront fee: US\$1,000,000.00

Asking royalty rate: 5% of Sales

Asking guaranteed minimum yearly payments:

Yr 1: US\$1 million

Yr 2: US\$1 million

Yr 3: US\$1 million

Yr 4: US\$1 million

Yr 5: US\$1 million

Yr 6: US\$1 million

Yr 7: US\$1 million

Yr 8: US\$1 million

Yr 9: US\$1 million

Yr 10: US\$1 million

Yr 11: US\$1 million

Yr 12: US\$1 million

Yr 13: US\$1 million

Yr 14: US\$1 million

Yr 15: US\$1 million

Yr 16: US\$1 million

Yr 17: US\$1 million

Yr 18: US\$1 million

The "out clause" will release buyers from making minimum payments if the technology fails to gain FDA approval.

Asking milestone payments:

a. The asset gains regulatory approval.

# DECLARATION FOR PATENT APPLICATION AND POWER OF ATTORNEY

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below adjacent to my name.

I believe I am the original, first and joint inventor of subject matter (process, machine, manufacture, or composition of matter, or an improvement thereof) which is claimed and for which a patent is sought by way of the application entitled

## ONLINE PATENT AND LICENSE EXCHANGE

which (check) ☒ is attached hereto.  
☐ and is amended by the Preliminary Amendment attached hereto.  
☐ was filed on \_\_\_\_\_ as Application Serial No.  
☐ and was amended on \_\_\_\_ (if applicable).

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information, which is material to patentability as defined in Title 37, Code of Federal Regulations, § 1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, § 119(a)-(d) of any foreign application(s) for patent or inventor's certificate or any PCT international application(s) designating at least one country other than the United States of America listed below and have also identified below any foreign application(s) for patent or inventor's certificate or any PCT international application(s) designating at least one country other than the United States of America filed by me on the same subject matter having a filing date before that of the application(s) of which priority is claimed:

Prior Foreign Application(s)			Priority Claimed	
Number	Country	Day/Month/Year Filed	Yes	No
N/A			<input type="checkbox"/>	<input checked="" type="checkbox"/>

I hereby claim the benefit under Title 35, United States Code, § 119(e) of any United States provisional application(s) listed below:

Provisional Application Number	Filing Date
60/124,847	3/17/99

I hereby claim the benefit under Title 35, United States Code, § 120 of any United States application(s) or PCT international application(s) designating the United States of America listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior application(s) in the manner provided by the first paragraph of Title 35, United States Code, § 112, I acknowledge the duty to disclose information, which is material to patentability as defined in Title 37, Code of Federal Regulations, § 1.56, which became available between the filing date of the prior application(s) and the national or PCT international filing date of this application:

Application Serial No.	Filing Date	Status (patented, pending, abandoned)
09/371,614	8/10/99	Pending

I hereby appoint the following attorney(s) and/or agent(s) to prosecute this application and to transact all business in the United States Patent and Trademark Office connected therewith:

Alan H. MacPherson (24,423); Brian D. Ogonowsky (31,988); David W. Heid (25,875); Norman R. Klivans (33,003); Edward C. Kwok (33,938); David E. Steuber (25,557); Michael Shenker (34,250); Stephen A. Terrile (32,946); Peter H. Kang (40,350); Ronald J. Meetin (29,089); Ken John Koestner (33,004); Omkar K. Suryadevara (36,320); David T. Millers (37,396); Michael P. Adams (34,763); Robert B. Morrill (43,817); Michael J. Halbert (40,633); Gary J. Edwards (41,008); James E. Parsons (34,691); Daniel P. Stewart (41,332); Philip W. Woo (39,880); John T. Winburn (26,822); Tom Chen (42,406); Fabio E. Marino (43,339); William W. Holloway (26,182); Don C. Lawrence (31,975); Marc R. Ascolese (42,268); Carmen C. Cook (42,433); David G. Dolezal (41,711); Roberta P. Saxon (43,087); Mary Jo Bertani (42,321); Dale R. Cook (42,434); Sam G. Campbell (42,381); Matthew J. Brigham (44,047); Hugh H. Matsubayashi (43,779); Patrick D. Benedicto (40,909); T.J. Singh (39,535); Shireen Irani Bacon (40,494); Rory G. Bens (44,028); George Volken, Jr. (30,441); John A. Odozynski (28,769); Cameron K. Kerrigan (44,826); Paul E. Lewkowicz (44,870); Theodore P. Lopez (44,881); Mayankkumar M. Dixit (44,064); Eric Stephenson (38,321); Christopher Allenby (45,906); David C. Hsia (46,235); Mark J. Rozman (42,117); and Margaret M. Kelton (44,182).
